

Paper Types for ACM Sponsored and ICPS Conference Proceedings

To begin the rights capture process, conference leadership must load their paper data to ACM's e-Rights system via either a CSV or XML file.

Each paper in your CSV or XML file must have a paper type that is recognized by the ACM e-Rights system as a valid paper type for conference proceedings. For each title, please enter the most appropriate selection from Column 1 below – no other paper types will be accepted:

Paper Type	Definition	Prescribed # of Pages (recommended)	Published Paper Type (paper type as it will appear in the ACM Digital Library)
abstract	A concise summary of a research article that gives readers a quick overview of the essential content of the article.	1-5 pages	abstract
brief-report	A short and/or rapid announcement of research results.	1-5 pages	brief-report
course	Intended to support instruction, teaching, training, or professional development; can include lecture notes, lab exercises, case studies, or problem sets.	No page limits	course
demonstration	A description or explanation of system, prototype, algorithm, or application.	No page limits	demonstration
editorial	Opinion piece, policy statement, or general commentary, typically written by staff of the publication.	No page limits	editorial
extended abstract	Provides a summary of a research article, typically just enough for readers to understand the idea, scope, and potential impact. Often lacks full methodology, detailed results, or extensive references. Often peer-reviewed only for relevance and quality and is published in conference proceedings.	1-5 pages	extended-abstract
full paper	An article that reports on original or primary research, such as experiments, which typically contains an abstract, introduction, method, results, discussion sections, references, figures, tables, and footnotes. May be accompanied by research artifacts and supplementary materials. Fully peer-reviewed.	5+ pages	research-article

introduction	The opening section of a research article, book, or report that introduces the work. Not intended as a standalone content type.	1-2 pages	introduction
invited talk	Speakers who have been invited to give a talk by the organizers of a conference on a particular topic. Speakers may choose to not submit a paper at all (though ACM prefer that they do) .	Null or 1-n	invited-talk
invited talk abstract	A state-of-the-art overview of the field or topic that is not focused solely on the speakers' own work.	1-4 pages	invited-talk
keynote	An invited presentation by a prestigious individual intended to set the tone, theme, or intellectual direction of a conference. The speaker may choose to not submit a paper at all (though ACM prefer that they do).	Null or 1-n	keynote
obituary	Announcement of a death, or a tribute to a colleague recently deceased.	1-3 pages	obituary
oration	A transcription of a speech or an oral presentation.	No page limits	oration
panel	A group of people gathered to conduct a public discussion, judge a contest, or serve as advisers.	1-6 pages	panel
plenary talk	A talk during a conference or similar meeting that is scheduled at a time when everyone can attend, i.e. at a time when nothing else is scheduled.	1-2 pages	plenary-talk
poster	A visual or interactive form of presenting information at a conference where findings are summarized on a display board and discussed with attendees.	1-3 pages	poster
prefatory	Of, relating to, or constituting a preface; to preface the introductory remarks of a speaker or author.	1-2 pages	preface
short paper	An article that reports on original research and contains many of the same characteristics of a research article, but tends to be shorter in length. Typically presented at an academic conference or workshop, it presents preliminary findings that may later be published as a full-length original research article and are often intended to stimulate further research in a field. Intended to be self-contained like a research article. Fully peer-reviewed.	4-6 pages	short-paper
technical note	A concise contribution that does not warrant a full-length paper but is of interest to the field. Often used for new methods, preliminary results, negative results, dataset descriptions, or	2-5 pages	technical-note

	clarifications of existing work. A way to communicate findings rapidly and succinctly. This paper type label also applies to works of the type “note” and “editorial note.”		
tutorial	A structured educational session intended to teach participants about a specific topic, method, or tool.	5+ pages	tutorial
work-in-progress	A brief scholarly communication that reports on early-stage or ongoing research. Intended to share promising ideas or preliminary results before the work is complete. Intended to get feedback and stimulate discussion.	1-4 pages	work in progress

The CSV File – A Definition of Terms

As mentioned, paper data for conference proceedings can be uploaded to the ACM e-Rights system in either a CSV or XML file. If you choose CSV, then the data for each paper *must* be arranged in the following format:

proceedingID,event_tracking_number/theirnumber,paper_type,thetitle,prefix,first_name,middle_name,last_name,suffix,author_sequence_no,contact_author,ACM_profile_id,ACM_client_no,orcid,email,department_school_lab,institution/AFFILIATION,city,state_province,country,secondary_department_school_lab,secondary_institution,secondary_city,secondary_state_province,secondary_country,section_title,section_seq_no,published_article_number,start_page,end_page,article_seq_no,art_submission_date,art_approval_date,source,abstract

Most of these fields are self-explanatory, though some do require elaboration, which we provide here. Mandatory and optional fields are indicated as such:

“proceedingID” = mandatory; You will find this data within ACM’s instruction email (for ICPS proceedings, this is sent to the contact on file after the event was approved into the ICPS program). The proceedings ID is generated specifically for your proceedings.

“event_tracking_number” = mandatory; the number or ID that you assigned to the paper (usually provided by a conference management or tracking system)

“paper_type” = mandatory; refer to the list of **valid** paper types at the start of this document and use the prescribed # of pages as a guide to make the most appropriate selection

“thetitle” = mandatory; the paper’s title as it will appear in the proceedings (*all* titles must be in English and in mixed case; all-caps should be used only for acronyms)

“last_name” = mandatory; all authors must have a last name; for authors who have only one name, enter that one name in the “last_name” field. In addition, do not populate the “middle_name” field if you intend to leave the “first_name” field blank – this will result in an upload error

“author_sequence_no” = mandatory; for papers with multiple authors, you must enter ‘1’ for the first author, ‘2’ for the second, etc.

“contact_author” = mandatory; if the entry is for the paper’s contact author, enter ‘yes’ – for everyone else, enter ‘no’ (note that each paper must have only one contact author)

“ACM_profile_id” = optional; almost never provided for conference proceedings entries

“ACM_client_no” = optional; almost never provided for conference proceedings entries

“orcid” = mandatory; a unique author ID (ORCID) can be set up at orcid.org/register and be connected to the author’s ACM profile. ORCIDs allow ACM to more reliably identify authors, even when there are variants in the use of their names or when multiple authors share the same name.

“email” = mandatory; each author must have their own *unique* email address (duplicate emails for the same paper will result in an error)

“department_school_lab”, “state_province” = optional fields connected to the author’s affiliation (note that “affiliation”, “city”, and “country” are all required fields; for authors who are independently employed, work as consultants, etc., enter “Self” as the affiliation and their own city/state/country in the city/state/country fields)

“**secondary**” fields = all optional; fill in only if the author has a secondary affiliation

“section_title” = optional; if your proceedings has multiple sections, indicate in which section the paper belongs

“section_seq_no” = optional; where the paper needs to be positioned within the section (e.g. ‘3’ for the third paper in the section)

“published_article_number” = optional; if you wish the table of contents in the ACMDL to list article numbers next to each paper—rather than having the proceedings volume paginated—please enter the published article number in this position (e.g. ‘19’ for Article No. 19 in the proceedings). If you wish for your proceedings to be paginated instead, please leave this field blank.

“article_seq_no” = optional; we use this field to position each paper within the Table of Contents (i.e., sort order). Please enter the article_seq_no for each paper (e.g. ‘19’ for the 19th paper in the entire proceedings)

“art_submission_date” = optional; The date the article was submitted to the Conference for review – MM/DD/YYYY

“art_approval_date” = optional; The date the article was approved by the Conference review committee – MM/DD/YYYY

“source” = mandatory; the name of the conference management software that was used to prepare the data; if the file was manually created, enter the name of the proceedings copyright contact person

“abstract” = optional; the abstract of the paper as it will be published in the ACM Digital Library

“role” = optional; note that there are only 11 valid contributor values: author , advisor , editor , translator , panelist , moderator , staff , corporate , reviewer , interviewee , speaker (can be used only if the paper type is keynote, invited talk, or invited talk abstract)

“institutional_email” = optional; if any co-author is affiliated with an [ACM Open institution](#), their institutional email address must be entered in this field in order for their paper to become Open Access in the ACM Digital Library

“papers_submitted” = optional; number of research papers submitted to the conference

“papers_accepted” = optional; number of research papers accepted to the conference

Some helpful tips:

- The metadata in the ACMDL will be derived “as is” from the ACM e-Rights system. This means that the CSV (or XML) file that you upload will determine how the paper title, author list, and author affiliations will appear on the ACMDL pages. On that note, please make this information as correct and accurate as possible.
- To better appreciate the formatting of your CSV file—and to make edits more easily—you can open it in WordPad.

- Optional fields must be acknowledged. Even if you have no data to enter in these fields, simply leave them blank – do not delete them.
- Diacritics and mathematical symbols in names, affiliations, titles, etc., must be captured correctly. While we will check for higher ASCII codes, the check is not perfect and there are instances when we cannot convert characters correctly. To ensure that your data is captured correctly, please use the conversion tool found at <https://codecside.com/3rdpage/us/unicode/converter.html> to get the decimal HTML entity code for the special character being used. For example, Mevlevioğlu should be entered as Mevlevioğl
- All authors' names must be in mixed case (i.e. the first letters of the first, middle, and last names are capitalized; all other letters in the name are in lowercase). The only time an author's name should be entered in all-caps/all-lowercase is if the author prefers that their byline be rendered in this style in the ACM Digital Library. Free of style preferences, names need to be entered in mixed case.
- In title, subtitle, and author affiliations, ACM accepts the following HTML tags to format authors' data correctly: , <i>, <small>, <sub>, and <sup>. We also accept common Unicode entities in these fields as well.
